Manager Investment Management Portfolio

Today's agenda

- 1. Trends in GIDI Industrial projects
- 2. GIDI Contestable what's next
- 3. Launching EECA's new Equipment Replacement Scheme
- 4. Update on our Regional ETA programme
- 5. Overview of our ROI for biomass supply in the South Island
- 6. Questions

At our last update we told you what's in focus for EECA right now

- The Regional Energy Transition Accelerator programme
- Partnerships with Large Energy Users
- The GIDI pipeline and ensuring visibility so public and private can work as a team and make the
 most of opportunities
- Support for SMEs
- Gearing up for 2023 which will be the year of the **Equipment Replacement Scheme**

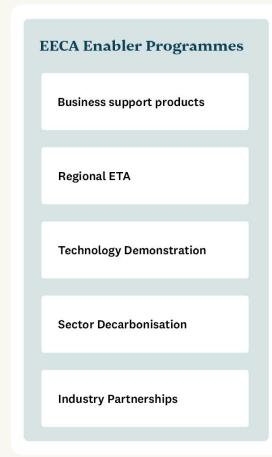

Today we'll give you an update on a big 3 months of progress and what's ahead

Our context

GIDI industrial projects can be complex

- Many GIDI projects are New Zealand firsts, and not standard projects.
- This means new supply chains, first time ever design, technology new to New Zealand, contractors who are learning about it on the job, and lots of unknowns.
- It is rewarding work and together we're at the cutting edge. But there is a need to **build in contingency**, **get** as much advice as you can, join dots, and have a plan B.

Emerging trends in industrial GIDI projects

Projects are experiencing timeframe delays.

Design phases are taking longer due to:

- changing upstream supply and delivery dynamics
- cost overruns
- · access to experienced resource; and
- prolonged connection negotiations.

Common issues with commissioning include:

- unplanned resource/building consents required
- unexpected engineering challenges resulting in additional design work: and
- new operating SOPs and training required as the technology is not standard across the industry.

The future of GIDI

- **GIDI Fund: Industrial** will replace the GIDI contestable funding rounds from 1 July 2023.
- The eligibility and assessment criteria are largely unchanged.
- We will be accepting proposals at any time from 1 July 2023, assessment will start as applications are received.
- Details on the application and assessment process will be made available through the GIDI webpage in mid-June.
- We are expecting an announcement on Round 4 projects towards the end of April.
- Round 5 projects are currently being assessed by the Technical Advisory Group, and decisions are expected late May/early June.

Launching EECA's new Equipment Replacement Scheme

\$330 million to spend over next 7 years

Targets:

- 1,000 ktC02e by end of BP1
- 13,000 Gwh saved by end of BP1

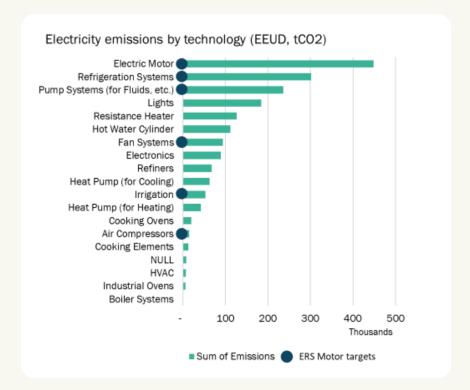

ERS is for:

 SMEs (but not exclusively) and small, less complex fuel switch or energy efficiency opportunities

Four priority technologies:

- Water heating (HWHPs)
- Space heating
- Commercial lighting systems
- Electric motor systems

Priority technologies – ERS motor system targets

ERS: Hot water heat pumps

Small hot water heat pumps

- 0.4 Mt of low temperature gas emissions come from commercial boiler and hot water systems
- Heat pumps are 3-5x more energy efficient than natural gas boilers
- 15 50 kW boilers are simple to replace with 'air-to-water' heat pump hot water systems
- Found in commercial buildings, retirement villages, restaurants, hotels, spas, food processing, breweries, covered cropping, sports facilities
- Our RFP to set up a national panel of installers is set to go live
- We expect to launch early June
- Automated approval process with automatically calculated 30-50% EECA co-funding

ERS: Commercial lighting

Commercial lighting systems

- New Zealand could save over 1000 GWh of electricity each year by switching fluorescents for LEDs
- Switching delivers an average of 46% energy and cost savings
- Our pilot kicked off in January setting up an open panel of commercial lighting assessors
- We're trialling assessors generating the market activity and making funding requests – six months then evaluation
- These assessors are in market now speaking to business and doing lighting assessments
- We can refer any businesses interested now in EECA co-funding for commercial lighting, get in touch

ERS: Electric motors

- Motors represent 74% of total global industrial electricity consumption
- There are 260,000 3-phase motors in New Zealand;
 22,000 new sold every year
- EECA's EEUD data shows that electric motor systems consumed 11,000 GWh in 2020
- Our pilot kicked off in December setting up a small panel of assessors. We commissioned 20 project reports, the first six cover 350 units alone. They're starting to come in and we're making decisions about co-funding the kit
- We'll be trialling and learning for the next six months

Introducing our Commercial Buildings funding

We're working hard on a commercial buildings grant funding application process for projects over \$300k

- Aiming to launch 1 July 2023
- Targeting water and space heating
- Funding is for the *replacement* of water and space heating with cleaner, more energy efficient technology
- Our Commercial Buildings Sector Decarbonisation programme launched in February, Aged Care launches in April and Hotels in May.
- Find out more or sign up for the programme on the EECA website.
- Our Insight piece about heat pumps for commercial buildings goes live end of April

We are accelerating action regionally with RETA

Regional engagement, more than just a report

- Who: Process heat users, biomass industry, EDB's, regional stakeholders
- South Island well progressed, kicking off in the North
- Auckland and Waikato need additional information
- Complete the planning phase: Sth Is mid-23, Nth Is mid-24
- Stakeholders/service providers: Engage with the information, your clients

Implementation - has already started

- Workshops designed to facilitate connections and collaboration
- Supply chain awareness and confidence of future market
- Cluster opportunities to optimise investment and accelerate timelines
- Regional commitment all suppliers and stakeholders support goals
- Enable EECA support channels

Biomass Supply Chain Investment Fund – South Island ROI

Increase biomass supply in the South Island

- ROI: register projects that have the potential to increase biomass supply for process heat decarbonisation in the South Island
- RFP: assess and select projects for Government co-investment to increase the harvest of biomass residue and supply of boiler-ready fuel in the South Island

We want to support:

- Projects that enable the decarbonisation of domestic process heat
- New large-scale collection hubs for forestry residues or processed residues
- Technologies that would increase forestry residue collection
- Projects that would process raw material into boiler-ready fuel

Date	Step
21-Mar-23	ROI Open
29-Mar-23	Applicant briefing session
28-Apr-23	ROI Closes - Applicant deadline
June 2023	Panel recommendation and approvals
+30 days	Applicants notified of decision
July 2023	Successful applicant invited to RFP

Two step process:

This RFP will only be open to those suppliers that participate in the ROI and are shortlisted through that process.

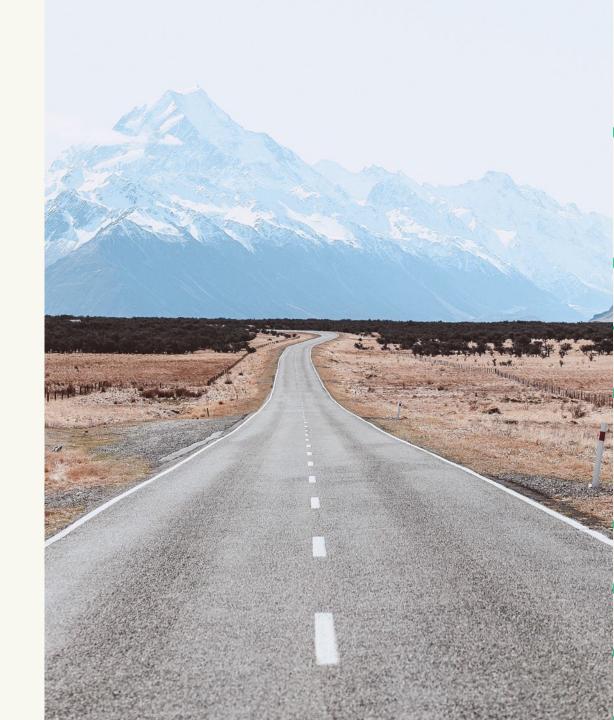

Next steps

- Look for opportunities that fit your business or your clients
- New programmes are launched in our newsletters make sure you're signed up!
- Give us feedback or suggestions
- Help us promote our programmes
- Help us build market confidence in technology and processes
- Thanks to those involved in the pilots

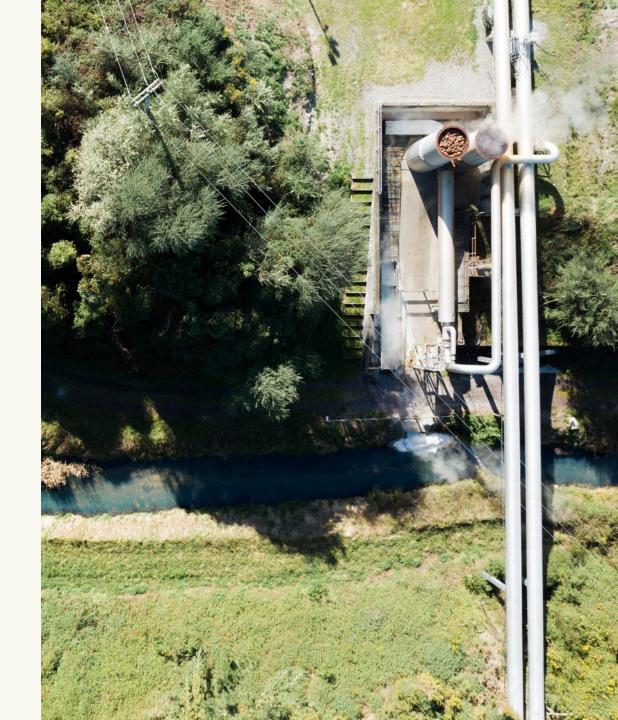

What's next?

Join our EECA Market Update webinar in July 2023

It will cover:

- An introduction to our Commercial Buildings grant funding programme
- Our work on the abatement cost "sweet spot" for government support
- What's next for our Sector Decarbonisation Programme
- Latest insights from our research programme
- Latest updates to our business support products
- A reminder project nominations are open for the 2023 New Zealand Energy Excellence Awards. Details are available on the www.energyawards.co.nz website.
